

**AMENDMENTS TO THE ABSTRACT**

Please substitute the following paragraph(s) for the abstract now appearing in the currently filed specification:

There are provided a method and a device for creating print data, a program for creating print data, and a recording medium capable of accurately adjusting the position of the print image of pre-printing with the print image of post-printing when performing CTP printing, regardless of generation of fan-out, without performing control of the position correction of the imaging device in the printing plate creation device or without correcting the image position when creating a printing plate of the data for creating digitized printing plate. Deformation information on the direction of expansion/contraction to be performed on an object to be printed is set and expansion/contraction correction of the direction corresponding to the expansion/contraction is performed for the image type data on the print data according to the corresponding position data the deformation information.
